

The Password is dynamic and depends on the first two characters entered.

The first two characters must be bigger than eight (ASCII value) and the first character of these two characters must be bigger than the second character (ASCII value) otherwise the program exits. A carriage return will also result in existing the program.

The variable TRY is not being used for the password at all.

Thereafter the dynamic password is the count down between the first character and the second character (ASCII value).

The Maximum number of character for the password cannot exceed 12.

For examples:

```
Enter password HCHGFEDC  
Correct. You made it!
```

```
Enter password zvzyxwv  
Correct. You made it!
```
